📍 Krakow, Poland

Hi,

I design how people hand work to AI agents and stay in control while it happens. For more than a decade I have turned complex technical systems into experiences people can trust, and I would like to bring that systems-level thinking to a team working through real ambiguity.

At Google I work on the shift from using tools to collaborating with autonomous agents. That includes what people see before an agent acts, consent they can actually refuse, how they step in when it gets stuck, and how trust is earned over time. Much of this is 0-to-1 work with no established patterns. A large part of the job is getting large cross-functional teams to agree on a direction before all the evidence is in. I also co-authored a public guide to building agent-friendly websites.

My approach is rooted in measurable impact. As Chief Designer at Kemppe I led digital initiatives in industrial products that contributed to a 20 percent revenue increase, and the work earned Red Dot design awards. As Senior UX Designer at Fortum I aligned user needs with the goals of a sustainable energy business and helped raise app ratings by about 50 percent.

Across wearables, medical devices, industrial platforms and AI software the thread is the same: structure first, predictable control, and friction only where it protects someone. That is what I would bring to your team.

I would welcome the chance to talk about it.

Best,
